DEGREE EXPONENT SUM ENERGY OF A GRAPH

BOMMANAHAL BASAVANAGOUD* AND CHITRA ESHWARACHANDRA1

ABSTRACT. In this paper, we introduce a matrix associated with a graph called degree exponent sum matrix. We compute the degree exponent sum polynomial of graph operations, cycle related graphs, product related graphs and transformation graphs. We give bounds for the largest degree exponent sum eigenvalue and degree exponent sum energy of a graph.

1. Introduction

The energy of a graph is the sum of absolute values of eigenvalues of its adjacency matrix. It has a correlation with the total \(\pi\)-electron energy of a molecule in the quantum chemistry as calculated with the Hückel molecular orbital method ([16]).

Let \(G\) be a simple, finite, undirected, nontrivial graph with \(n\) vertices and \(m\) edges. Let \(V(G) = \{v_1, v_2, \ldots, v_n\}\) be a vertex set and \(E(G) = \{e_1, e_2, \ldots, e_m\}\) be an edge set of \(G\). The degree \(d_G(v_i)\) (or simply \(d_i\)) of a vertex \(v_i\) is the number of vertices adjacent to it in \(G\). The graph \(G\) is an \(r\)-regular graph if the degree of every vertex in \(G\) is \(r\).

The adjacency matrix \(A(G) = [a_{ij}]\) of a graph \(G\) ([18]) is a matrix of order \(n \times n\), whose elements are defined as

\[
a_{ij} = \begin{cases} 
1, & \text{if } v_i \text{ is adjacent to } v_j, \\
0, & \text{otherwise.}
\end{cases}
\]

The characteristic polynomial of \(A(G)\) is given by \(\phi(G : \lambda) = \det(\lambda I_n - A(G))\), where \(I_n\) is an identity matrix of order \(n\). The roots of an equation \(\phi(G : \lambda) = 0\) are called the eigenvalues of \(G\) and they are labeled as \(\lambda_1, \lambda_2, \ldots, \lambda_n\). The collection of eigenvalues of \(G\) is called the spectrum of \(G\) denoted by \(\text{Spec}(G)\), refer to ([11]). The two nonisomorphic graphs are cospectral if they have the same spectra. The energy \(\epsilon(G)\) of a graph \(G\) with \(n\) vertices is defined as \(\epsilon(G) = \sum_{i=1}^{n} |\lambda_i|\), refer to ([15]). For undefined graph theoretic terminologies and notations, one can refer to ([18]) or ([19]).

Followed by the adjacency matrix, many other graph matrices are defined in literature such as distance matrix ([1]), Laplacian matrix ([20]), signless Laplacian
matrix ([12, 22]), degree sum matrix ([23]), Seidel matrix ([7]), degree square sum matrix ([2, 3]), minimum degree matrix ([4]) etc.

We introduce a new matrix associated with a graph $G$ called degree exponent sum matrix of order $n \times n$ given by $DES(G) = \begin{bmatrix} des_{ij} \end{bmatrix}$ and whose elements are defined as

$$des_{ij} = \begin{cases} d_i^d_j + d_j^d_i, & \text{if } i \neq j, \\ 0, & \text{otherwise.} \end{cases}$$

Here, $d_i$ is degree of a vertex $v_i$ and $d_j$ is degree of a vertex $v_j$. The degree exponent sum polynomial of a graph $G$ is defined as

$$P_{DES(G)}(\mu) = \det(\mu I_n - DES(G)),$$

where $I_n$ is an identity matrix. The eigenvalues of $DES(G)$ are called the degree exponent sum eigenvalues of $G$, denoted by $\mu_1, \mu_2, \ldots, \mu_n$ and their collection is called the degree exponent sum spectra of $G$. The degree exponent sum energy $E_{DES}(G)$ of a graph $G$ is defined as $E_{DES}(G) = \sum_{i=1}^{n} |\mu_i|$.

For an $r$-regular graph $G$, $DES(G) = 2r^r J_n - 2r^r I_n$, where $J_n$ is a matrix of order $n \times n$ whose all entries are equal to 1. Therefore, for an $r$-regular graph $G$ of order $n$,

$$P_{DES(G)}(\mu) = \left(\mu - 2r^r(n - 1)\right) \left(\mu + 2r^r\right)^{n-1}.$$  \hfill (1.1)

**Example 1.1.** Let $H = C_4$ be a cycle. The degree exponent sum matrix, degree exponent sum polynomial and degree exponent sum energy of $H$ are as follows:

$$DES(H) = \begin{bmatrix} 0 & 8 & 8 & 8 \\ 8 & 0 & 8 & 8 \\ 8 & 8 & 0 & 8 \\ 8 & 8 & 8 & 0 \end{bmatrix},$$

$$P_{DES(H)}(\mu) = \mu^4 - 384\mu^2 - 4096\mu - 12288,$$

$$E_{DES(H)} = 48.$$  \hfill (1.1)

**Example 1.2.** Let $G = K_4 - e$, where $e$ is an edge of $K_4$. The degree exponent sum matrix, degree exponent sum polynomial and degree exponent sum energy of $G$ are as follows:
54 B. BASAVANAGOUD, CHITRA E.

Definition 2.1. ([18]) The union $G_1 \cup G_2$ of graphs $G_1$ and $G_2$ is a graph whose vertex set is $V(G_1 \cup G_2) = V(G_1) \cup V(G_2)$ and an edge set is $E(G_1 \cup G_2) = E(G_1) \cup E(G_2)$. The join $G_1 + G_2$ of two graphs $G_1$ and $G_2$ is a graph obtained from $G_1$ and $G_2$ by joining every vertex of $G_1$ to all vertices of $G_2$. The cartesian product $G_1 \times G_2$ of two graphs $G_1 = (V_1(G_1), E_1(G_1))$ and $G_2 = (V_2(G_2), E_2(G_2))$ is defined as follows: Consider any two vertices $u = (u_1, u_2)$ and $v = (v_1, v_2)$ in $V(G_1 \times G_2) = V_1(G_1) \times V_2(G_2)$. The two vertices $u$ and $v$ are adjacent in $G_1 \times G_2$ whenever $(u_1 = v_1$ and $u_2v_2 \in E(G_2))$ or $(u_2 = v_2$ and $u_1v_1 \in E(G_1))$. The composition $G_1[G_2]$ of two graphs $G_1$ and $G_2$ is defined as follows: Consider any two vertices $u = (u_1, u_2)$ and $v = (v_1, v_2)$ in $V(G_1[G_2]) = V_1(G_1) \times V_2(G_2)$. The two vertices $u$ and $v$ are adjacent in $G_1[G_2]$ whenever $(u_1v_1 \in E(G_1))$ or $(u_1 = v_1$ and $u_2v_2 \in E(G_2))$. The corona $G_1 \circ G_2$ of graphs $G_1$ and $G_2$ is a graph obtained from $G_1$ and $G_2$ by taking one copy of $G_1$ and $|V(G_1)|$ copies of $G_2$ and then joining by an edge each vertex of the $i^{th}$ copy of $G_2$ is named $(G_2, i)$ with the $i^{th}$ vertex of $G_1$.

Definition 2.2. ([18]) For $n \geq 4$, the graph $W_n = C_{n-1} + K_1$ is called a wheel graph. In $W_n$, a vertex of degree $n - 1$ is called a central vertex and the vertices on the cycle $C_{n-1}$ are called rim vertices.

Definition 2.3. ([14]) Let $C_n^{(t)}$ denote the one-point union of $t \geq 2$ cycles of length $n$. The graph $C_3^{(t)}$ is called a friendship graph. The helm $H_n$ is a graph obtained from a wheel $W_n$ by attaching a pendant edge at each vertex of a cycle $C_{n-1}$. The closed helm $H'_n$ is a graph obtained from a helm $H_n$ by joining each pendant vertex to form a cycle. The sunflower graph $SF_n$ is a graph obtained from a wheel with central vertex $v_0$, $(n-1)$-cycle $v_1, v_2, \ldots, v_{n-1}, v_1$ and additional

\[ DES(G) = \begin{bmatrix} 0 & 17 & 54 & 17 \\ 17 & 0 & 17 & 8 \\ 54 & 17 & 0 & 17 \\ 17 & 8 & 17 & 0 \end{bmatrix}, \]

\[ P_{DES(G)}(\mu) = \mu^4 - 4136\mu^2 - 71672\mu - 312768, \]

\[ E_{DES}(G) \approx 144.097503. \]
n − 1 vertices \( w_1, w_2, \ldots, w_{n-1} \), where \( w_i \) is joined by edges to \( v_i, v_{i+1} \) for \( i = 1, 2, \ldots, n-1 \), where \( i + 1 \) is taken modulo \( n - 1 \). The double cone \( DC_n \) is a graph \( C_n + 2K_1 \). The book graph \( B_t \) is a graph \( K_{1,b} \times P_2 \). A book with triangular pages \( B_t \) is a graph \( P_2 + tK_1 \) where \( t \geq 1 \). The graph \( P_n \times P_2 \) is called a ladder graph \( L_n \). The prism \( \Pi_n \) is a graph \( C_n \times P_2 \). The triangular snake \( T_n \) is obtained from the path \( P_n \) by replacing each edge of a path by a triangle \( C_3 \). The quadrilateral snake \( Q_n \) is obtained from the path \( P_n \) by replacing each edge of the path by a cycle \( C_4 \).

**Definition 2.4.** The complement \( \overline{G} \) of a graph \( G ([18]) \) is a graph with vertex set \( V(G) \) and two vertices of \( \overline{G} \) are adjacent if and only if they are nonadjacent in \( G \). The (line graph) \( L(G) \) of a graph \( G ([18]) \) is defined as a graph with vertex set as \( E(G) \) where the two vertices of \( L(G) \) are adjacent if and only if they correspond to two adjacent edges of \( G \). The \( k^{th} \) iterated line graph \( L^k(G) \) of \( G ([8, 9, 18]) \) is a graph defined as \( L(L^{k-1}(G)), k = 1, 2, \ldots, \) where \( L^1(G) \equiv G \) and \( L^0(G) \equiv L(G) \). The jump graph \( J(G) \) of a graph \( G ([10]) \) is defined as a graph with vertex set as \( E(G) \) where the two vertices of \( J(G) \) are adjacent if and only if they correspond to two nonadjacent edges of \( G \). The subdivision graph \( S(G) \) of a graph \( G ([18]) \) is defined as a graph with vertex set \( V(G) \cup E(G) \) and is obtained by inserting a new vertex of degree 2 into each edge of \( G \). The semitotal point graph \( T_2(G) \) of a graph \( G ([25]) \) is defined as a graph with vertex set \( V(G) \cup E(G) \) where two vertices of \( T_2(G) \) are adjacent if and only if they correspond to two adjacent vertices of \( G \) or one is a vertex of \( G \) and another is an edge \( G \) incident with it in \( G \). The semitotal line graph \( T_1(G) ([25]) \) or middle graph \( M(G) ([17]) \) of a graph \( G \) is a graph with vertex set \( V(G) \cup E(G) \) where two vertices are adjacent if and only if they correspond to two adjacent edges of \( G \) or one is a vertex of \( G \) and another is an edge \( G \) incident with it in \( G \). The total graph \( T(G) \) of a graph \( G ([18]) \) is defined as a graph with vertex set \( V(G) \cup E(G) \) and two vertices of \( T(G) \) are adjacent if and only if the corresponding elements (vertices and edges) of \( G \) are either adjacent or incident.

The following lemma is useful for computing degree exponent sum polynomial of graphs.

**Lemma 2.5.** ([24]) If \( a, b, c \) and \( d \) are real numbers, then the determinant of the form

\[
\begin{vmatrix}
(\mu + a)I_{n_1} - aJ_{n_1} & -cJ_{n_1 \times n_2} \\
-dJ_{n_2 \times n_1} & (\mu + b)I_{n_2} - bJ_{n_2}
\end{vmatrix}
\]

(2.1)
of order \( n_1 + n_2 \) can be expressed in the simplified form as

\[(\mu + a)^{n_1-1}(\mu + b)^{n_2-1}\left((\mu - (n_1 - 1)a)(\mu - (n_2 - 1)b) - n_1n_2cd\right).
\]

We use the below mentioned relations in computing the bounds for degree exponent sum energy.
Theorem 3.1. If for each graph of order \( n \) \( G \) where
\[
\left( \sum_{i=1}^{n} a_i b_i \right)^2 \leq \left( \sum_{i=1}^{n} a_i^2 \right) \left( \sum_{i=1}^{n} b_i^2 \right). \tag{2.2}
\]

Theorem 2.6. (21) If \( a_i \) and \( b_i \) are nonnegative real numbers, then
\[
\sum_{i=1}^{n} a_i^2 \sum_{i=1}^{n} b_i^2 - \left( \sum_{i=1}^{n} a_i b_i \right)^2 \leq \frac{n^2}{4} (M_1 M_2 - m_1 m_2)^2, \tag{2.3}
\]
where \( M_1 = \max_{1 \leq i \leq n}(a_i) \); \( M_2 = \max_{1 \leq i \leq n}(b_i) \); \( m_1 = \min_{1 \leq i \leq n}(a_i) \); \( m_2 = \min_{1 \leq i \leq n}(b_i) \).

Theorem 2.7. (6) If \( a_i \) and \( b_i \) are nonnegative real numbers, then
\[
\left| n \sum_{i=1}^{n} a_i b_i - \sum_{i=1}^{n} a_i \sum_{i=1}^{n} b_i \right| \leq \alpha(n)(A - a)(B - b), \tag{2.4}
\]
where \( a, b, A \) and \( B \) are real constants such that \( a \leq a_i \leq A \) and \( b \leq b_i \leq B \) for each \( i, 1 \leq i \leq n \). Further, \( \alpha(n) = n \left\lceil \frac{\alpha}{2} \right\rceil \left( 1 - \frac{1}{n} \left\lceil \frac{\alpha}{2} \right\rceil \right) \).

Theorem 2.8. (13) If \( a_i \) and \( b_i \) are nonnegative real numbers, then
\[
\sum_{i=1}^{n} b_i^2 + C_1 C_2 \sum_{i=1}^{n} a_i^2 \leq (C_1 + C_2) \left( \sum_{i=1}^{n} a_i b_i \right), \tag{2.5}
\]
where \( C_1 \) and \( C_2 \) are real constants such that \( C_1 a_i \leq b_i \leq C_2 a_i \) for each \( i, 1 \leq i \leq n \).

3. Degree exponent sum polynomial of graph operations

Theorem 3.1. If \( G \) is an \( r_1 \)-regular graph of order \( n_1 \) and \( H \) is an \( r_2 \)-regular graph of order \( n_2 \), then
\[
P_{DES(G \cup H)}(\mu) = (\mu + 2r_1^{r_1})^{n_1-1}(\mu + 2r_2^{r_2})^{n_2-1} \left( (\mu - 2(n_1 - 1)r_1^{r_1})(\mu - 2(n_2 - 1)r_2^{r_2}) - n_1 n_2 (r_1^{r_1} + r_2^{r_2})^2 \right).
\]

Proof. The graph \( G \cup H \) has two types of vertices, the \( n_1 \) vertices of degree \( r_1 \) and the remaining \( n_2 \) vertices are of degree \( r_2 \). Hence,
\[
DES(G \cup H) = \begin{bmatrix}
2r_1^{r_1} (J_{n_1} - I_{n_1}) & (r_1^{r_1} + r_2^{r_1}) J_{n_1 \times n_2} \\
(r_1^{r_1} + r_2^{r_1}) J_{n_2 \times n_1} & 2r_2^{r_2} (J_{n_2} - I_{n_2})
\end{bmatrix}
\]
and
\[
P_{DES(G \cup H)}(\mu) = \begin{bmatrix}
\mu I - DES(G \cup H)
\end{bmatrix}
= \begin{bmatrix}
(r_1^{r_1} + r_2^{r_1}) J_{n_1 \times n_2} & - (r_1^{r_1} + r_2^{r_1}) J_{n_1 \times n_2} \\
-(r_1^{r_1} + r_2^{r_1}) J_{n_2 \times n_1} & (\mu + 2r_2^{r_2}) J_{n_2} - 2r_2^{r_2} (J_{n_2})
\end{bmatrix}.
\]
Using Lemma 2.5, we get the required result. \( \Box \)
Theorem 3.2. If $G$ is an $r_1$-regular graph of order $n_1$ and $H$ is an $r_2$-regular graph of order $n_2$, then

$$P_{DES(G+H)}(\mu) = (\mu + 2R_1^{R_1})^{n_1-1}(\mu + 2R_2^{R_2})^{n_2-1}\left(\frac{(\mu - 2(n_1 - 1)R_1^{R_1})(\mu - 2(n_2 - 1)R_2^{R_2}) - n_1n_2(R_1^{R_1} + R_2^{R_2})^2}{-2(n_2 - 1)R_2^{R_2} - n_1n_2(R_1^{R_1} + R_2^{R_2})^2}\right).$$

Proof. The graph $G + H$ has two types of vertices, the $n_1$ vertices of degree $R_1 = r_1 + n_2$ and the remaining $n_2$ vertices are of degree $R_2 = r_2 + n_1$. Hence,

$$DES(G + H) = \begin{bmatrix} 2R_1^{R_1}(I_{n_1} - J_{n_1}) & (R_1^{R_1} + R_2^{R_2})J_{n_1 \times n_2}^{n_1} & 2R_2^{R_2}(J_{n_2} - I_{n_2}) \\ (R_1^{R_1} + R_2^{R_2})J_{n_2 \times n_1}^{n_2} & 2R_2^{R_2}(J_{n_2} - I_{n_2}) & \end{bmatrix}$$

and

$$P_{DES(G+H)}(\mu) = |\mu I - DES(G + H)|$$

Using Lemma 2.5, we get the required result.

Theorem 3.3. If $G$ is an $r_1$-regular graph of order $n_1$ and $H$ is an $r_2$-regular graph of order $n_2$, then

$$P_{DES(G \times H)}(\mu) = \left(\frac{\mu - 2(n_1n_2 - 1)(r_1 + r_2)^{r_1+r_2}}{\mu + 2(r_1 + r_2)^{r_1+r_2}}\right)^{n_1n_2-1}.$$  

Proof. The graph $G \times H$ is an $(r_1 + r_2)$-regular graph with $n_1n_2$ vertices. Hence, the result follows from Eq. (1.1).

Theorem 3.4. If $G$ is an $r_1$-regular graph of order $n_1$ and $H$ is an $r_2$-regular graph of order $n_2$, then

$$P_{DES(G[H])}(\mu) = \left(\frac{\mu - 2(n_1n_2 - 1)(n_2r_1 + r_2)^{n_2r_1+r_2}}{\mu + 2(n_2r_1 + r_2)^{n_2r_1+r_2}}\right)^{(n_1n_2-1)}.$$  

Proof. The graph $G[H]$ is an $(n_2r_1 + r_2)$-regular graph with $n_1n_2$ vertices. Hence, the result follows from Eq. (1.1).

Theorem 3.5. If $G$ is an $r_1$-regular graph of order $n_1$ and $H$ is an $r_2$-regular graph of order $n_2$, then

$$P_{DES(G \ominus H)}(\mu) = \left(\frac{\mu + 2R_1^{R_1}}{\mu + 2R_2^{R_2}}\right)^{n_1n_2-1}\left(\frac{\mu - 2(n_1 - 1)R_1^{R_1})(\mu - 2(n_2 - 1)R_2^{R_2}) - n_1n_2(R_1^{R_1} + R_2^{R_2})^2}{-2(n_1n_2 - 1)R_2^{R_2} - n_1n_2(R_1^{R_1} + R_2^{R_2})^2}\right).$$

Proof. The graph $G \ominus H$ has two types of vertices, the $n_1$ vertices with degree $R_1 = r_1 + n_2$ and the remaining $n_2$ vertices are of degree $R_2 = r_2 + 1$. Hence,

$$DES(G \ominus H) = \begin{bmatrix} 2R_1^{R_1}(I_{n_1} - J_{n_1}) & (R_1^{R_1} + R_2^{R_2})J_{n_1 \times n_2}^{n_1} & 2R_2^{R_2}(J_{n_1n_2} - I_{n_1n_2}) \\ (R_1^{R_1} + R_2^{R_2})J_{n_2 \times n_1}^{n_2} & 2R_2^{R_2}(J_{n_1n_2} - I_{n_1n_2}) & \end{bmatrix}$$
and
\[
P_{\text{DES}(G \circ H)}(\mu) = |\mu I - \text{DES}(G \circ H)|
= \begin{vmatrix}
(\mu + 2R_1^{R_1})I_n - 2R_1^{R_1}J_{n_1} & -(R_1^{R_2} + R_2^{R_1})J_{n_1 \times n_1} \\
-(R_1^{R_2} + R_2^{R_2})J_{n_1 \times n_1} & (\mu + 2R_2^{R_2})I_{n_1 n_2} - 2R_2^{R_2}J_{n_1 n_2}
\end{vmatrix}.
\]

Using Lemma 2.5, we get the required result. \(\square\)

4. Degree exponent sum polynomial of cycle related graphs and product related graphs

**Theorem 4.1.** If \(W_n\) is a wheel graph, then

\[
P_{\text{DES}(W_n)}(\mu) = (\mu + 54)^{n-2}\left(\mu (\mu - 54(n - 2)) - (n - 1) \left(3^{n-1} + (n - 1)^3\right)^2\right).
\]

*Proof.* The graph \(W_n\) of order \(n\) has two types of vertices namely, \(n - 1\) rim vertices are of degree 3 and central vertex has degree \(n - 1\). Hence,

\[
\text{DES}(W_n) = \begin{bmatrix}
54(J_{n-1} - I_{n-1}) & (3^{n-1} + (n - 1)^3)J_{(n-1)\times 1}
\\
(3^{n-1} + (n - 1)^3)J_{1\times (n-1)} & 2(n-1)^2(J_1 - I_1)
\end{bmatrix}
\]

and

\[
P_{\text{DES}(W_n)}(\mu) = |\mu I - \text{DES}(W_n)|
= \begin{vmatrix}
(\mu + 54)I_{n-1} - 54J_{n-1} & -(3^{n-1} + (n - 1)^3)J_{(n-1)\times 1}
\\
-(3^{n-1} + (n - 1)^3)J_{1\times (n-1)} & (\mu + 2(n-1)^2)I_1 - 2(n-1)^2J_1
\end{vmatrix}.
\]

Using Lemma 2.5, we get the desired result. \(\square\)

**Theorem 4.2.** If \(C_3^{(t)}\) is a friendship graph, then

\[
P_{\text{DES}(C_3^{(t)})}(\mu) = (\mu + 8)^{2t-1}\left(\mu (\mu - 8(2t - 1)) - (2t - 1) \left(2^{2t} + (2t)^2\right)^2\right).
\]

*Proof.* The graph \(C_3^{(t)}\) of order \(2t + 1\) has two types of vertices namely, \(2t\) vertices of degree 2 and 1 vertex of degree 2. Hence,

\[
\text{DES}(C_3^{(t)}) = \begin{bmatrix}
8(J_{2t} - I_{2t}) & (2^{2t} + (2t)^2)J_{(2t)\times 1}
\\
(2^{2t} + (2t)^2)J_{1\times (2t)} & 2(2t)^{2t}(J_1 - I_1)
\end{bmatrix}
\]

and

\[
P_{\text{DES}(C_3^{(t)})}(\mu) = |\mu I - \text{DES}(C_3^{(t)})|
= \begin{vmatrix}
(\mu + 8)I_{2t} - 8J_{2t} & -(2^{2t} + (2t)^2)J_{(n-1)\times 1}
\\
-(2^{2t} + (2t)^2)J_{1\times (2t)} & 0
\end{vmatrix}.
\]

Using Lemma 2.5, we get the desired result. \(\square\)

**Theorem 4.3.** If \(H_n - c\) is a helm without central vertex, then

\[
P_{\text{DES}(H_n - c)}(\mu) = (\mu + 54)^{n-2}(\mu + 2)^{n-2}\left((\mu - 54(n - 2)) (\mu - 2(n - 2)) - 16(n - 1)^2\right).
\]

Proof. The helm $H_n - c$ without central vertex is a graph of order $2(n-1)$, which has two types of vertices. The $n - 1$ vertices have degree $3$ and the remaining $n - 1$ vertices have degree $1$. Hence,

$$DES(H_n - c) = \begin{bmatrix} 54(J_{n-1} - I_{n-1}) & 4J_{(n-1)\times(n-1)} - 2(J_{n-1} - I_{n-1}) \end{bmatrix}$$

and

$$P_{DES(H_n - c)}(\mu) = |\mu I - DES(H_n - c)| = \begin{vmatrix} (\mu + 54)I_{n-1} - 54J_{n-1} & -4J_{(n-1)\times(n-1)} - 2J_{n-1} \\ -4J_{(n-1)\times(n-1)} & (\mu + 2)I_{n-1} - 2J_{n-1} \end{vmatrix}. $$

Using Lemma 2.5, we get the desired result.

\[ \square \]

**Theorem 4.4.** If $H'_n - c$ is a closed helm without central vertex, then

$$P_{DES(H'_n - c)}(\mu) = (\mu - 54(2n-3))(\mu + 54)^{2n-3}. $$

Proof. The closed helm without central vertex $H'_n - c$ is a $3$-regular graph with $2(n - 1)$ vertices. Hence, the result follows from Eq. (1.1).

\[ \square \]

**Theorem 4.5.** If $SF_n - c$ is a sunflower graph without central vertex, then

$$P_{DES(SF_n - c)}(\mu) = (\mu + 54)^{n-2}(\mu + 8)^{n-2}(\mu - 54(n-2))(\mu - 8(n-2))$$

$$-289(n-1)^2. $$

Proof. The sunflower graph $SF_n - c$ without central vertex is a graph of order $2(n-1)$, which has two types of vertices. The $n - 1$ vertices have degree $3$ and the remaining $n - 1$ vertices have degree $2$. Hence,

$$DES(SF_n - c) = \begin{bmatrix} 54(J_{n-1} - I_{n-1}) & 17J_{(n-1)\times(n-1)} \\ 17J_{(n-1)\times(n-1)} & 8(J_{n-1} - I_{n-1}) \end{bmatrix}$$

and

$$P_{DES(SF_n - c)}(\mu) = |\mu I - DES(SF_n - c)| = \begin{vmatrix} (\mu + 54)I_{n-1} - 54J_{n-1} & -17J_{(n-1)\times(n-1)} \\ -17J_{(n-1)\times(n-1)} & (\mu + 8)I_{n-1} - 8J_{n-1} \end{vmatrix}. $$

Using Lemma 2.5, we get the desired result.

\[ \square \]

**Theorem 4.6.** If $DC_n$ is a double cone, then

$$P_{DES(DC_n)}(\mu) = (\mu + 512)^{n-1}(\mu + 2n^n)\left((\mu - 512(n - 1))(\mu - 2n^n) - 2n(4^n + n^4)^2\right). $$

Proof. The double cone is a graph of order $n + 2$ has two types of vertices. The $n$ vertices have degree $3$ and the remaining $2$ vertices have degree $n$. Hence,

$$DES(DC_n) = \begin{bmatrix} 512(J_n - I_n) & (4^n + n^4)J_{n\times2} \\ (4^n + n^4)J_{2\times n} & 2n^2(J_2 - I_2) \end{bmatrix}$$

and

$$P_{DES(DC_n)}(\mu) = |\mu I - DES(DC_n)| = \begin{vmatrix} (\mu + 512)I_n - 512J_n \\ -512J_{n\times2} & (\mu + 2n^n)I_n - 2n(4^n + n^4)J_{n\times2} \end{vmatrix}. $$

Using Lemma 2.5, we get the desired result.

\[ \square \]
and
\[ P_{DES(DC_n)}(\mu) = |\mu I - DES(DC_n)| \]
\[ = \begin{vmatrix} (\mu + 512)I_n - 512J_n & - (4^n + n^4)J_{n \times 2} \\ -(4^n + n^4)J_{2 \times n} & (\mu + 2n^3)I_2 - 2n^2J_2 \end{vmatrix} . \]

Using Lemma 2.5, we get the expected result.

\[ \square \]

**Theorem 4.7.** If \( B_b \) is a book graph, then
\[ P_{DES(B_b)}(\mu) = (\mu + 8)^{2b-1}(\mu + 2(b + 1)^{b+1}) \left( (\mu - 8(2b - 1)) (\mu - 2(b + 1)^{b+1}) \right) 
- 4b \left( 2^{b+1} + (b + 1)^2 \right)^2 . \]

**Proof.** The Book graph \( B_b \) has two types of vertices. The \( 2b \) vertices with degree 2 and 2 vertices are with degree \( b + 1 \). Hence,
\[ DES(B_b) = \begin{bmatrix} 8(J_{2b} - I_{2b}) & (2^{b+1} + (b + 1)^2)J_{2b \times 2} \\ (2^{b+1} + (b + 1)^2)J_{2 \times 2b} & 2(b + 1)^{b+1}(J_2 - I_2) \end{bmatrix} \]
and
\[ P_{DES(B_b)}(\mu) = |\mu I - DES(B_b)| \]
\[ = \begin{vmatrix} (\mu + 8)J_{2b} - 8J_{2b} & -(2^{b+1} + (b + 1)^2)J_{2b \times 2} \\ -(2^{b+1} + (b + 1)^2)J_{2 \times 2b} & (\mu + 2(b + 1)^{b+1})J_2 - 2(b + 1)^{b+1}J_2 \end{vmatrix} . \]

Using Lemma 2.5, we get the desired result.

\[ \square \]

**Theorem 4.8.** If \( B_t \) is a book with triangular pages, then
\[ P_{DES(B_t)}(\mu) = (\mu + 8)^{t-1}(\mu + 2(t + 1)^{t+1}) \left( (\mu - 8(t - 1))(\mu - 2(t + 1)^{t+1}) \right) 
- 2t(2^{t+1} + (t + 1)^2)^2 . \]

**Proof.** The book \( B_t \) with triangular pages of order \( t + 2 \) has two types of vertices. The \( t \) vertices have degree 2 and the remaining 2 vertices have degree \( t + 1 \). Hence,
\[ DES(B_t) = \begin{bmatrix} 8(J_t - I_t) & (2^{t+1} + (t + 1)^2)J_{t \times 2} \\ (2^{t+1} + (t + 1)^2)J_{2 \times t} & 2(t + 1)^{t+1}(J_2 - I_2) \end{bmatrix} \]
and
\[ P_{DES(B_t)}(\mu) = |\mu I - DES(B_t)| \]
\[ = \begin{vmatrix} (\mu + 8)J_t - 8J_t & -(2^{t+1} + (t + 1)^2)J_{t \times 2} \\ -(2^{t+1} + (t + 1)^2)J_{2 \times t} & (\mu + 2(t + 1)^{t+1})J_2 - 2(t + 1)^{t+1}J_2 \end{vmatrix} . \]

Using Lemma 2.5, we get the required result.

\[ \square \]

**Theorem 4.9.** If \( L_n \) is a ladder graph, then
\[ P_{DES(L_n)}(\mu) = (\mu + 54)^{2n-5}(\mu + 8)^3 \left( (\mu - 54(2n - 5))(\mu - 24) - 1156(2n - 4) \right) . \]
Proof. The ladder graph $L_n$ is a graph of order $2n$ and has two types of vertices. The 4 vertices have degree 2 and $2n - 4$ vertices have degree 3. Hence,

$$DES(L_n) = \begin{bmatrix} 54(J_{2n-4} - I_{2n-4}) & 17J_{(2n-4)\times 4} \\ 17J_{4\times (2n-4)} & 8(J_4 - I_4) \end{bmatrix}$$

and

$$P_{DES(L_n)}(\mu) = |\mu I - DES(L_n)|$$

$$= \begin{vmatrix} (\mu + 54)I_{2n-4} - 54J_{2n-4} & -17J_{(2n-4)\times 4} \\ -17J_{4\times (2n-4)} & (\mu + 8)I_4 - 8J_4 \end{vmatrix}.$$ 

Using Lemma 2.5, we get the expected result. □

Theorem 4.10. If $\Pi_n$ is a prism graph, then

$$P_{DES(\Pi_n)}(\mu) = (\mu - 54(2n - 1))(\mu + 54)^{2n-1}.$$ 

Proof. The prism $\Pi_n$ is a 3-regular graph with $2n$ vertices. Hence, the result follows from Eq. (1.1). □

Theorem 4.11. If $T_n$ is a triangular snake, then

$$P_{DES(T_n)}(\mu) = (\mu + 8)^n(\mu + 512)^{n-3}\left((\mu - 8n)(\mu - 512(n - 3)) - 1024(n + 1)(n - 2)\right).$$

Proof. The triangular snake $T_n$ has two types of vertices. The $n + 1$ vertices have degree 2 and the remaining $n - 2$ vertices have degree 4. Hence,

$$DES(T_n) = \begin{bmatrix} 8(J_{n+1} - I_{n+1}) & 32J_{(n+1)\times (n+2)} \\ 32J_{(n-2)\times (n+1)} & 512(J_{n-2} - I_{n-2}) \end{bmatrix}$$

and

$$P_{DES(T_n)}(\mu) = |\mu I - DES(T_n)|$$

$$= \begin{vmatrix} (\mu + 8)I_{n+1} - 8J_{n+1} & -32J_{(n+1)\times (n+2)} \\ -32J_{(n-2)\times (n+1)} & (\mu + 512)I_{n-2} - 512J_{n-2} \end{vmatrix}.$$ 

Using Lemma 2.5, we get the desired result. □

Theorem 4.12. If $Q_n$ is a quadrilateral snake, then

$$P_{DES(Q_n)}(\mu) = (\mu + 8)^{2n-1}(\mu + 512)^{n-3}\left((\mu - 8(2n - 1))(\mu - 512(n - 3)) - 2048n(n - 2)\right).$$

Proof. The quadrilateral snake $Q_n$ is a graph of order $3n - 2$, which has two types of vertices. The $2n$ vertices have degree 2 and the remaining $n - 2$ vertices have degree 4. Hence,

$$DES(Q_n) = \begin{bmatrix} 8(J_{2n} - I_{2n}) & 32J_{2n\times (n-2)} \\ 32J_{(n-2)\times 2n} & 512(J_{n-2} - I_{n-2}) \end{bmatrix}$$
and
\[ P_{\text{DES}(Q_n)}(\mu) = |\mu I - \text{DES}(Q_n)| \]
\[ = \begin{vmatrix} (\mu + 8)I_{2n} - 8J_{2n} & -32J_{2nx(n-2)} \\ -32J_{(n-2)x2n} & (\mu + 512)I_{n-2} - 512J_{n-2} \end{vmatrix}. \]

Using Lemma 2.5, we get the desired result.

5. Degree exponent sum polynomial of some transformation graphs

Theorem 5.1. If \( G \) is an \( r \)-regular graph of order \( n \), then
\[ P_{\text{DES}(\overline{G})}(\mu) = \left( \mu - 2(n - 1)(n - 1 - r)^{(n-1-r)} \right)\left( \mu + 2(n - 1 - r)^{(n-1-r)} \right)^{n-1}. \]

Proof. The complement of an \( r \)-regular graph is an \( (n - 1 - r) \)-regular graph with \( n \) vertices. Hence, the result follows from Eq. (1.1).

Theorem 5.2. If \( G \) is an \( r \)-regular graph of order \( n \) and \( n_k \) is the order of \( L^k(G) \) \((k = 1, 2, \ldots)\), then
\[ P_{\text{DES}(L^k(G))}(\mu) = \left( \mu + 2(2^k r - 2^{k+1} + 2)^{2^k r - 2^{k+1} + 2} \right)^{n_k-1} \left( \mu - 2(n_k - 1)(2^k r - 2^{k+1} + 2)^{2^k r - 2^{k+1} + 2} \right). \]

Proof. The line graph of a regular graph is a regular graph. In particular, the line graph of an \( r \)-regular graph \( G \) of order \( n \) is an \( r_1 = (2^k r - 2^{k+1} + 2)^{2^k r - 2^{k+1} + 2} \)-regular graph with \( n_1 = \frac{1}{2} nr \) vertices. Thus, \( L^k(G) \) is an \( r_k \)-regular graph of order \( n_k \) given by
\[ n_k = \frac{n}{2^k} \prod_{i=0}^{k-1} (2^i r - 2^{i+1} + 2) \quad \text{and} \quad r_k = 2^k r - 2^{k+1} + 2. \]

Hence, the result follows from Eq. (1.1).

Theorem 5.3. If \( G \) is an \( r \)-regular graph of order \( n \), then
\[ P_{\text{DES}(J(G))}(\mu) = \left( \mu - 2r_1^{r_1} \left( \frac{n r}{2} - 1 \right) \right)\left( \mu + 2r_1^{r_1} \left( \frac{n r}{2} - 1 \right) \right). \]

Proof. The jump graph of an \( r \)-regular graph is \( r_1 = (\frac{n-4}{2} r + 1) \)-regular graph with \( \frac{nr}{2} \) vertices. Hence, the result follows from Eq. (1.1).

Theorem 5.4. If \( G \) is an \( r \)-regular graph of order \( n \), then
\[ P_{\text{DES}(S(G))}(\mu) = (\mu + 2r r)^{n-1} \left( \mu + 8 \left( \frac{nr}{2} - 1 \right) \right) \left( \mu - 2r r(n - 1) \right) \left( \mu - 8 \left( \frac{nr}{2} - 1 \right) \right) \]
\[ - \frac{n^2 r}{2} (r^2 + 2^r). \]
Proof. The subdivision graph of an $r$-regular graph has two types of vertices. The $n$ vertices with degree $r$ and $\frac{nr}{2}$ vertices with degree 2. Hence,

$$DES(S(G)) = \left[ \begin{array}{c|c}
2r^r(J_n - I_n) & (r^2 + 2r)J_{n \times \frac{nr}{2}} \\
(2^r + r^2)J_{\frac{nr}{2} \times n} & 8(J_{\frac{nr}{2}} - I_{\frac{nr}{2}})
\end{array} \right]$$

and

$$P_{DES(S(G))}(\mu) = |\mu I - DES(S(G))| = \left| \begin{array}{c|c}
(\mu + 2r^r)I_n - 2r^r J_n & -(r^2 + 2r)J_{n \times \frac{nr}{2}} \\
-(2^r + r^2)J_{\frac{nr}{2} \times n} & (\mu + 8)I_{\frac{nr}{2}} - 8J_{\frac{nr}{2}}
\end{array} \right| .$$

Using Lemma 2.5, we get the desired result. □

**Theorem 5.5.** If $G$ an an $r$-regular graph of order $n$, then

$$P_{DES(T_2(G))}(\mu) = \left( \begin{array}{c|c}
\mu + 2(2r)^2r & (\mu - 2(n-1)(2r)^2r)(\mu \\
-n^2r & (4r^2 + 2r^2r)^2
\end{array} \right) .$$

Proof. The semitotal point graph of an $r$-regular graph has two types of vertices. The $n$ vertices with degree $2r$ and $\frac{nr}{2}$ vertices have degree 2. Hence,

$$DES(T_2(G)) = \left[ \begin{array}{c|c}
2(2r)^2r(J_n - I_n) & (4r^2 + 2r^2r)J_{n \times \frac{nr}{2}} \\
(4r^2 + 2r^2r)J_{\frac{nr}{2} \times n} & 8(J_{\frac{nr}{2}} - I_{\frac{nr}{2}})
\end{array} \right]$$

and

$$P_{DES(T_2(G))}(\mu) = |\mu I - DES(T_2(G))| = \left| \begin{array}{c|c}
(\mu + 2(2r)^2r)I_n - 2(2r)^2r J_n & -(4r^2 + 2r^2r)J_{n \times \frac{nr}{2}} \\
-(4r^2 + 2r^2r)J_{\frac{nr}{2} \times n} & (\mu + 8)I_{\frac{nr}{2}} - 8J_{\frac{nr}{2}}
\end{array} \right| .$$

The result follows from Lemma 2.5. □

**Theorem 5.6.** If $G$ is an $r$-regular graph of order $n$, then

$$P_{DES(T_1(G))}(\mu) = (\mu + 2r^r)^{n-1}(\mu + 2(2r)^2r)^{\frac{nr}{2}-1} \left( (\mu - 2(n-1)r^r)(\mu - 2(\frac{nr}{2} - 1)(2r)^2r) - \frac{n^2r}{2}(r^2 + (2r)^r)^2 \right) .$$

Proof. The semitotal line graph of an $r$-regular graph has two types of vertices. The $n$ vertices with degree $r$ and the remaining $\frac{nr}{2}$ vertices are of degree $2r$. Hence,

$$DES(T_1(G)) = \left[ \begin{array}{c|c}
2r^r(J_n - I_n) & (r^{2r} + (2r)^r)J_{n \times \frac{nr}{2}} \\
(r^2 + (2r)^r)J_{\frac{nr}{2} \times n} & 2(2r)^{2r}(J_{\frac{nr}{2}} - I_{\frac{nr}{2}})
\end{array} \right]$$

and

$$P_{DES(T_1(G))}(\mu) = |\mu I - DES(T_1(G))| = \left| \begin{array}{c|c}
(\mu + 2r^r)I_n - 2r^r J_n & -(r^{2r} + (2r)^r)J_{n \times \frac{nr}{2}} \\
-(r^2 + (2r)^r)J_{\frac{nr}{2} \times n} & (\mu + 2(2r)^{2r})I_{\frac{nr}{2}} - 2(2r)^{2r}J_{\frac{nr}{2}}
\end{array} \right| .$$

The Lemma 2.5 gives the required result. □
Theorem 5.7. If $G$ is an $r$-regular graph of order $n$, then

$$P_{DES(T(G))}(\mu) = \left( \mu - 2 \left( n + \frac{nr}{2} - 1 \right) (2r)^2 \right) \left( \mu + 2(2r)^2 \right)^{n + \frac{nr}{2} - 1}.$$ 

Proof. The total graph of an $r$-regular graph is a regular graph of degree $2r$ with $n + \frac{nr}{2}$ vertices. Hence, the result follows from Eq. (1.1). \hfill \square

6. Bounds for the largest degree exponent sum eigenvalue and degree exponent sum energy

Theorem 6.1. The degree exponent sum eigenvalues of $DES(G)$ satisfies the following relations:

1. $\sum_{i=1}^{n} \mu_i = 0$,
2. $\sum_{i=1}^{n} \mu_i^2 = 2\omega$, where $\omega = \sum_{i<j} (d_i^{d_j} + d_j^{d_i})^2$.

Proof. By the definition of $DES(G)$,

$$\sum_{i=1}^{n} \mu_i = 0. \quad \quad (6.1)$$

Further,

$$\sum_{i=1}^{n} \mu_i^2 = \text{trace} \left( (DES(G))^2 \right)$$

$$= \sum_{i=1}^{n} \sum_{j=1}^{n} d_{ij}d_{ji}$$

$$= \sum_{i=1}^{n} \sum_{j=1}^{n} d_{ij}^2$$

$$= 2 \sum_{i<j} (d_i^{d_j} + d_j^{d_i})^2$$

$$= 2\omega, \text{ where } \omega = \sum_{i<j} (d_i^{d_j} + d_j^{d_i})^2. \quad \quad (6.2)$$

\hfill \square

Theorem 6.2. If $G$ is an $r$-regular graph of order $n$, then $G$ has only one positive degree exponent sum eigenvalue $\mu = 2r^2(n - 1)$.

Proof. Let $G$ be an $r$-regular graph of order $n$ and $\{v_1, v_2, \ldots, v_n\}$ be the vertex set of $G$. If $d_i = r$ is the degree of $v_i$, $i = 1, 2, \ldots, n$, then

$$d_{ij} = \begin{cases} d_i^{d_j} + d_j^{d_i} = 2r^2, & \text{if } i \neq j, \\ 0, & \text{otherwise}. \end{cases}$$
The degree exponent sum polynomial of $DES(G)$ is
\[
P_{DES(G)}(\mu) = \det(\mu I - DES(G))
\]
\[
= \det(\mu I - 2r^r A(K_n))
\]
\[
= (2r^r)^n \left| \frac{\mu}{2r^r} I - A(K_n) \right|
\]
\[
= (2r^r)^n \left( \frac{\mu}{2r^r} - n + 1 \right) \left( \frac{\mu}{2r^r} + 1 \right)^{n-1}
\]
\[
= (\mu - 2r^r(n-1))(\mu + 2r^r)^{n-1}.
\]

The characteristic equation of $DES(G)$ is
\[
(\mu - 2r^r(n-1))(\mu + 2r^r)^{n-1} = 0.
\]
This implies, $\mu = \{2r^r(n-1), \text{ once}, -2r^r, (n-1) \text{ times}. \}$

\[\]  
**Theorem 6.3.** If $G$ is any graph of order $n$ and $\mu_1$ is the largest degree exponent sum eigenvalue, then
\[
\mu_1 \leq \sqrt{\frac{2\omega(n-1)}{n}}. \quad (6.3)
\]

**Proof.** Substituting $a_i = 1$ and $b_i = \mu_i$ for $i = 2, 3, \ldots, n$ in inequality (2.2), we get
\[
\left( \sum_{i=1}^{n} \mu_i \right)^2 \leq (n-1) \left( \sum_{i=1}^{n} \mu_i^2 \right). \quad (6.4)
\]
From Eqs. (6.1) and (6.2), $\sum_{i=2}^{n} \mu_i = -\mu_1$ and $\sum_{i=2}^{n} \mu_i^2 = 2\omega - \mu_1^2$.
Inequality (6.4) is written as $(-\mu_1)^2 \leq (n-1)(2\omega - \mu_1^2)$.
This implies, $\mu_1 \leq \sqrt{\frac{2\omega(n-1)}{n}}$.
Equality holds if $G$ is a regular graph. \[\]

**Theorem 6.4.** If $G$ is an $r$-regular graph of order $n$, then $-2r^r$ and $2r^r(n-1)$ are degree exponent sum eigenvalues of $G$ with multiplicities $(n-1)$ and 1, respectively and $E_{DES}(G) = 4r^r(n-1)$.

**Proof.**
\[
| \mu I - DES(G) | = \begin{vmatrix}
\mu & -2r^r & -2r^r & \ldots & -2r^r \\
-2r^r & \mu & -2r^r & \ldots & -2r^r \\
-2r^r & -2r^r & \mu & \ldots & -2r^r \\
\vdots & \vdots & \vdots & \ddots & \vdots \\
-2r^r & -2r^r & -2r^r & \ldots & \mu \\
\end{vmatrix}
\]
\[
= (\mu + 2r^r)^{n-1} \begin{vmatrix}
\mu & -2r^r & \ldots & -2r^r \\
-1 & 1 & \ldots & 0 \\
-1 & 0 & \ldots & 0 \\
\vdots & \vdots & \ddots & \vdots \\
-1 & 0 & \ldots & 1 \\
\end{vmatrix}
\]
\[
= (\mu - 2r^r(n-1))(\mu + 2r^r)^{n-1}.
\]
Thus, $E_{DES}(G) = 4r^r(n-1)$.
Theorem 6.5. If $G$ is a graph of order $n$, then

$$E_{DES}(G) \geq \sqrt{2n\omega - \frac{n^2}{4}(|\mu_1| - |\mu_n|)^2}, \quad (6.5)$$

where $|\mu_1|$ and $|\mu_n|$ are maximum and minimum of the absolute value of $\mu_i$’s.

Proof. Substituting $a_i = 1$ and $b_i = |\mu_i|$ in inequality (2.3), we get

$$\sum_{i=1}^{n} 1^2 \sum_{i=1}^{n} |\mu_i|^2 - \left(\sum_{i=1}^{n} |\mu_i|\right)^2 \leq \frac{n^2}{4}(|\mu_1| - |\mu_n|)^2$$

$$2n\omega - (E_{DES}(G))^2 \leq \frac{n^2}{4}(|\mu_1| - |\mu_n|)^2$$

$$E_{DES}(G) \geq \sqrt{2n\omega - \frac{n^2}{4}(|\mu_1| - |\mu_n|)^2}.$$  

□

Theorem 6.6. If $G$ is a graph of order $n$, then

$$\sqrt{2\omega} \leq E_{DES}(G) \leq \sqrt{2n\omega}.$$  

Proof. Substituting $a_i = 1$ and $b_i = \mu_i$ in inequality (2.2), we get

$$\left(\sum_{i=1}^{n} |\mu_i|\right)^2 \leq \sum_{i=1}^{n} 1^2 \sum_{i=1}^{n} |\mu_i|^2$$

$$(E_{DES}(G))^2 \leq 2n\omega.$$  

This implies,

$$E_{DES}(G) \leq \sqrt{2n\omega}. \quad (6.6)$$

We have $(E_{DES}(G))^2 = \left(\sum_{i=1}^{n} |\mu_i|\right)^2 \geq \sum_{i=1}^{n} |\mu_i|^2 = 2\omega.$

This implies,

$$E_{DES}(G) \geq \sqrt{2\omega}. \quad (6.7)$$

Combining inequalities (6.6) and (6.7), we get the desired result.  

□

Theorem 6.7. If $G$ is a graph of order $n$ and $\Delta'$ be the absolute value of the determinant of $DES(G)$, then

$$\sqrt{2\omega + n(n-1)(\Delta')^{2/n}} \leq E_{DES}(G) \leq \sqrt{2n\omega}.$$
Proof. From the definition of degree exponent sum energy,

\[
(E_{DES}(G))^2 = \left( \sum_{i=1}^{n} |\mu_i| \right)^2 
\]

\[
= \sum_{i=1}^{n} \mu_i^2 + 2 \sum_{i<j} |\mu_i||\mu_j| 
\]

\[
= 2\omega + 2 \sum_{i<j} |\mu_i||\mu_j| 
\]

\[
= 2\omega + \sum_{i \neq j} |\mu_i||\mu_j|. 
\] (6.8)

For nonnegative numbers, the arithmetic mean is always greater than or equal to the geometric mean.

\[
\frac{1}{n(n-1)} \sum_{i \neq j} |\mu_i||\mu_j| \geq \left( \prod_{i \neq j} |\mu_i||\mu_j| \right)^{\frac{1}{n(n-1)}} 
\]

\[
= \left( \prod_{i=1}^{n} |\mu_i|^{2(n-1)} \right)^{\frac{1}{n(n-1)}} 
\]

\[
= \prod_{i=1}^{n} |\mu_i|^{2/n} 
\]

\[
= (\Delta')^{2/n}. 
\]

Therefore,

\[
\sum_{i \neq j} |\mu_i||\mu_j| \geq n(n-1)(\Delta')^{2/n}. 
\] (6.9)

Combining Eq. (6.8) and inequality (6.9), we get

\[
E_{DES}(G) \geq \sqrt{2\omega + n(n-1)(\Delta')^{2/n}}. 
\] (6.10)

Consider a nonnegative quantity

\[
Y = \sum_{i=1}^{n} \sum_{j=1}^{n} \left( |\mu_i| - |\mu_j| \right)^2 
\]

\[
= \sum_{i=1}^{n} \sum_{j=1}^{n} \left( |\mu_i|^2 - |\mu_j|^2 - 2|\mu_i||\mu_j| \right). 
\]

On direct expansion, we get

\[
Y = n \sum_{i=1}^{n} |\mu_i|^2 + n \sum_{j=1}^{n} |\mu_j|^2 - 2 \left( \sum_{i=1}^{n} |\mu_i| \right) \left( \sum_{j=1}^{n} |\mu_j| \right). 
\]

From the definition of degree exponent sum energy of a graph and Eq. (6.2), we have \( Y = 4n\omega - 2(E_{DES}(G))^2 \geq 0 \), since \( Y \geq 0 \).

So,

\[
E_{DES}(G) \leq \sqrt{2n\omega}. 
\] (6.11)

Combining inequalities (6.10) and (6.11), we get the desired result. \( \square \)
Corollary 6.8. If $G$ is an $r$-regular graph of order $n$, then 
\[ E_{DES}(G) \leq 2nr\sqrt{n-1}. \]

Theorem 6.9. If $G$ is a graph of order $n$ and $\mu_1 \geq \mu_2 \geq \cdots \geq \mu_n$ be a nonincreasing arrangement of degree exponent sum eigenvalues, then 
\[ E_{DES}(G) \geq \sqrt{2n\omega - \alpha(n)(|\mu_1| - |\mu_n|)^2}, \] (6.12)

where $\alpha(n) = n\left[\frac{n}{2}\right] (1 - \frac{1}{n}\left[\frac{n}{2}\right])$.

Proof. Substituting $a_i = |\mu_i| = b_i$, $a = |\mu_n| = b$ and $A = |\mu_1| = B$ in inequality (2.4), we get
\[ \left| n \sum_{i=1}^{n} |\mu_i|^2 - \left( \sum_{i=1}^{n} |\mu_i| \right)^2 \right| \leq \alpha(n)(|\mu_1| - |\mu_n|)^2. \] (6.13)

Since $E_{DES}(G) = \sum_{i=1}^{n} |\mu_i|$, $\sum_{i=1}^{n} |\mu_i|^2 = 2\omega$, we get the required result from (6.13). \[ \square \]

Remark 6.10. Since $\alpha(n) \leq \frac{n^2}{4}$, the lower bound (6.12) is sharper than the lower bound (6.5).

Theorem 6.11. If $G$ is a graph of order $n$ and $\mu_1 \geq \mu_2 \geq \cdots \geq \mu_n$ is a nonincreasing arrangement of degree exponent sum eigenvalues, then 
\[ E_{DES}(G) \geq \frac{|\mu_1||\mu_n|n + 2\omega}{|\mu_1| + |\mu_n|}, \]

where $|\mu_1|$ and $|\mu_n|$ are maximum and minimum of the absolute value of $\mu_i$’s.

Proof. Substituting $b_i = |\mu_i|$, $a_i = 1$, $C_1 = |\mu_n|$ and $C_2 = |\mu_1|$ in inequality (2.5), we get
\[ \sum_{i=1}^{n} |\mu_i|^2 + |\mu_1||\mu_n| \sum_{i=1}^{n} 1^2 \leq (|\mu_1| + |\mu_n|) \left( \sum_{i=1}^{n} |\mu_i| \right). \] (6.14)

Since $E_{DES}(G) = \sum_{i=1}^{n} |\mu_i|$ and $\sum_{i=1}^{n} |\mu_i|^2 = 2\omega$, (6.14) gives the required result. \[ \square \]

7. Conclusion

In this paper, we have added a new graph matrix to literature by introducing a degree exponent sum matrix. We have computed the degree exponent sum polynomial of graph operations, cycle related graphs, product related graphs and transformation graphs. We have given extension to our work to compute bounds for the largest degree exponent sum eigenvalue and degree exponent sum energy.
